

IdentityIQ

.....
A Smarter Way
to Manage Identity
.....

Managing access to information in today's dynamic, data-driven environment is a challenge, one that requires much more from identity and access management (IAM) solutions than ever before. To be effective, these solutions must deliver access to all the applications and information that business users need, when they need it, from wherever they are — while at the same time ensuring enterprise security policies are consistently enforced. And they must provide the transparency and proof of strong controls to satisfy audit and compliance requirements.

SailPoint is the recognized leader in identity and access management. IdentityIQ is a complete governance-based IAM solution that provides fast, convenient access to keep business users productive, and access controls that keep the business safe. Hundreds of the largest organizations around the world use IdentityIQ to integrate compliance management and provisioning in a unified solution that leverages a common identity governance framework to apply policy, role and risk models across all IAM processes.

Compliance Manager

IdentityIQ Compliance Manager enables the business to streamline compliance processes while lowering costs. By integrating access certifications, policy management and audit reporting, Compliance Manager automates the application of compliance controls associated with a strong identity governance program.

Business-friendly Access Certifications

- Reduces the cost and burden of compliance
- Simplifies setup, administration and tracking of user access reviews
- Streamlines access reviews by focusing on high-risk areas
- Automates removal of excess or inappropriate access rights

Automated Policy Management

- Rapidly defines and deploys policies across applications
- Automatically scans, detects and remediates violations
- Leverages risk to prioritize policy enforcement activities

Audit Reporting and Analytics

- Simplifies audit reporting with dashboards and pre-defined reports
- Provides transparency to IAM data across enterprise and cloud apps

Lifecycle Manager

IdentityIQ Lifecycle Manager delivers a business-oriented solution for managing changes to user access. By combining self-services tools for the business with automated user provisioning driven by IT, Lifecycle Manager delivers access quickly, securely, and cost-effectively.

Self-Service Access Request

- Empowers business users to manage access without contacting the helpdesk
- Easily guides users through the access request process
- Proactively applies policy controls

Automated Provisioning

- Detects lifecycle events then triggers the appropriate access change
- Initiates pre-defined or customer-configured business processes
- Automatically ensures access is aligned with policy
- Orchestrates changes via provisioning connectors or manual tasks

Integrated Password Management

- Eliminates help desk calls for password resets and changes
- Improves security by enforcing strong password policies across all applications
- Intercepts and synchronizes native password changes

Governance Platform

The IdentityIQ Governance Platform lays the foundation for both Compliance Manager and Lifecycle Manager by centralizing identity data and providing a single place to model roles, policies, risk, and business processes. This governance-based approach allows organizations to:

- Gain a single view of users, accounts, and entitlements across all applications, structured and unstructured resources for “big picture” visibility and control.
- Apply common policy across all IAM processes, avoiding inconsistencies and duplication of effort.
- Use roles to simplify the administration of user access and simplify end user access request.
- Quickly identify areas of access risk across users and applications to better focus controls.
- Save time and money by using a common, data-driven workflow engine.
- Speed deployment with pre-packaged connectors to platforms, databases, file shares, directories, mainframes, and business applications running in the datacenter or in the cloud.

Integration Modules are also available for third-party IT security and operations tools, including service management, mobile device management, provisioning, privileged user management, and security and event management solutions.

Identity Intelligence

IdentityIQ transforms technical identity data scattered across multiple enterprise systems into easily understood and business-relevant information through intuitive reporting and dashboards.

With identity intelligence, your organization can more quickly identify risks, spot compliance issues, and make the right decisions to improve effectiveness. SailPoint pioneered Identity Intelligence solutions and is a recognized industry leader in delivering business-relevant information for effective identity and access management.

IdentityIQ Allows Customers to:

Mitigate Risk of Inappropriate Access

Boost Productivity While Reducing Costs

Improve Audit Performance

Increase User Satisfaction

The difference is clear.

- IdentityIQ is designed for the business user, translating IT speak into actionable business information and simplifying the user experience.
- IdentityIQ is ready for today's complex hybrid IT environments and unifies identity management processes across cloud, mobile and on-premises environments.
- SailPoint's governance-based approach centralizes visibility, improves compliance, and minimizes risk by uniformly applying controls across all IAM services – significantly lowering deployment costs.
